

# 14 | Compact Spaces

**14.1 Definition.** Let  $X$  be a topological space. A *cover* of  $X$  is a collection  $\mathcal{Y} = \{Y_i\}_{i \in I}$  of subsets of  $X$  such that  $\bigcup_{i \in I} Y_i = X$ .

If the sets  $Y_i$  are open in  $X$  for all  $i \in I$  then  $\mathcal{Y}$  is an *open cover* of  $X$ . If  $\mathcal{Y}$  consists of finitely many sets then  $\mathcal{Y}$  is a *finite cover* of  $X$ .

**14.2 Definition.** Let  $\mathcal{Y} = \{Y_i\}_{i \in I}$  be a cover of  $X$ . A *subcover* of  $\mathcal{Y}$  is cover  $\mathcal{Y}'$  of  $X$  such that every element of  $\mathcal{Y}'$  is in  $\mathcal{Y}$ .

**14.4 Definition.** A space  $X$  is *compact* if every open cover of  $X$  contains a finite subcover.

**14.8 Proposition.** *Let  $f: X \rightarrow Y$  be a continuous function. If  $X$  is compact and  $f$  is onto then  $Y$  is compact.*

*Proof.* Exercise. □

**14.9 Corollary.** *Let  $f: X \rightarrow Y$  be a continuous function. If  $A \subseteq X$  is compact then  $f(A) \subseteq Y$  is compact.*

**14.10 Corollary.** *Let  $X, Y$  be topological spaces. If  $X$  is compact and  $Y \cong X$  then  $Y$  is compact.*

**14.12 Proposition.** *For any  $a < b$  the closed interval  $[a, b] \subseteq \mathbb{R}$  is compact.*

**14.13 Proposition.** *Let  $X$  be a compact space. If  $Y$  is a closed subspace of  $X$  then  $Y$  is compact.*

*Proof.* Exercise. □

**14.14 Proposition.** *Let  $X$  be a Hausdorff space and let  $Y \subseteq X$ . If  $Y$  is compact then it is closed in  $X$ .*

**14.15 Lemma.** *Let  $X$  be a Hausdorff space, let  $Y \subseteq X$  be a compact subspace, and let  $x \in X \setminus Y$ . There exists open sets  $U, V \subseteq X$  such that  $x \in U$ ,  $Y \subseteq V$  and  $U \cap V = \emptyset$ .*

**14.16 Corollary.** *Let  $X$  be a compact Hausdorff space. A subspace  $Y \subseteq X$  is compact if and only if  $Y$  is closed in  $X$ .*

*Proof.* Let  $A \subseteq X$  be a closed set. By Proposition 14.13  $A$  is a compact space and thus by Corollary 14.9  $f(A)$  is a compact subspace of  $Y$ . Since  $Y$  is a Hausdorff space, using Proposition 14.14 we obtain that  $f(A)$  is closed in  $Y$ .  $\square$

**14.18 Proposition.** *Let  $f: X \rightarrow Y$  be a continuous bijection. If  $X$  is a compact space and  $Y$  is a Hausdorff space then  $f$  is a homeomorphism.*

**14.19 Theorem.** *If  $X$  is a compact Hausdorff space then  $X$  is normal.*
